

# CSE 350

## Advanced Data Structures

### Topic 7: Serialization □

# Abstraction Mismatch

Permit#	Zip	State	Type
123	14228	NY	Electrical
125	14228	NY	Construction
127	10001	NY	Electrical

# Assumptions

- DB is one table
- We know schema
- We don't need to store it

given schema

provide

RID  $\rightarrow$  Record

(get)

Record  $\rightarrow$  RID  
(record store)

(put)

1. Record  $\rightarrow$  Bits ✓

2.  $\left. \begin{array}{l} \text{Bits } R_1 \\ \text{Bits } R_2 \\ \vdots \end{array} \right\} \rightarrow \text{Pages}$

3. Finding Pages in a Table

# Challenge 1: Record to Bits

$Flec = 1$

$Const = 2$

$Plumb = 3$

$\langle 123, 14228, MV, Flec \rangle$

$\langle 123, 14228, WY, T \rangle$

$\langle \underbrace{01111011}_{8\text{ bits}} \mid \text{---} \mid \text{---} \mid \text{---} \rangle$

$\underbrace{011101}_{\uparrow} \text{---} \text{---} \text{---} 010110 \text{---} \text{---} \text{---}$

## Variation 1: Fixed Layout

Pros

- $O(1)$  field access
- limited group overhead

Cons

- Wasted space or not useful at all for variable sized fields

## Variation 2: Delimiters

Pros / - variable length fields

Cons / - symbol can't appear in data

-  $O(\text{Record})$  CPU to access a field

## Variation 3: Headers

$16 \rightarrow 16 \rightarrow 16 \rightarrow 16 \rightarrow 30 \text{ bytes}$   
bits  
= 2 bytes  
8 3.8

Pros / - Variable Size Fields  
-  $O(1)$  access a field

Cons / - slightly slower than  
Fixed

- A few extra bytes  
per field

## Challenge 2: Records to Pages

All layers are the same  
↳ sort of

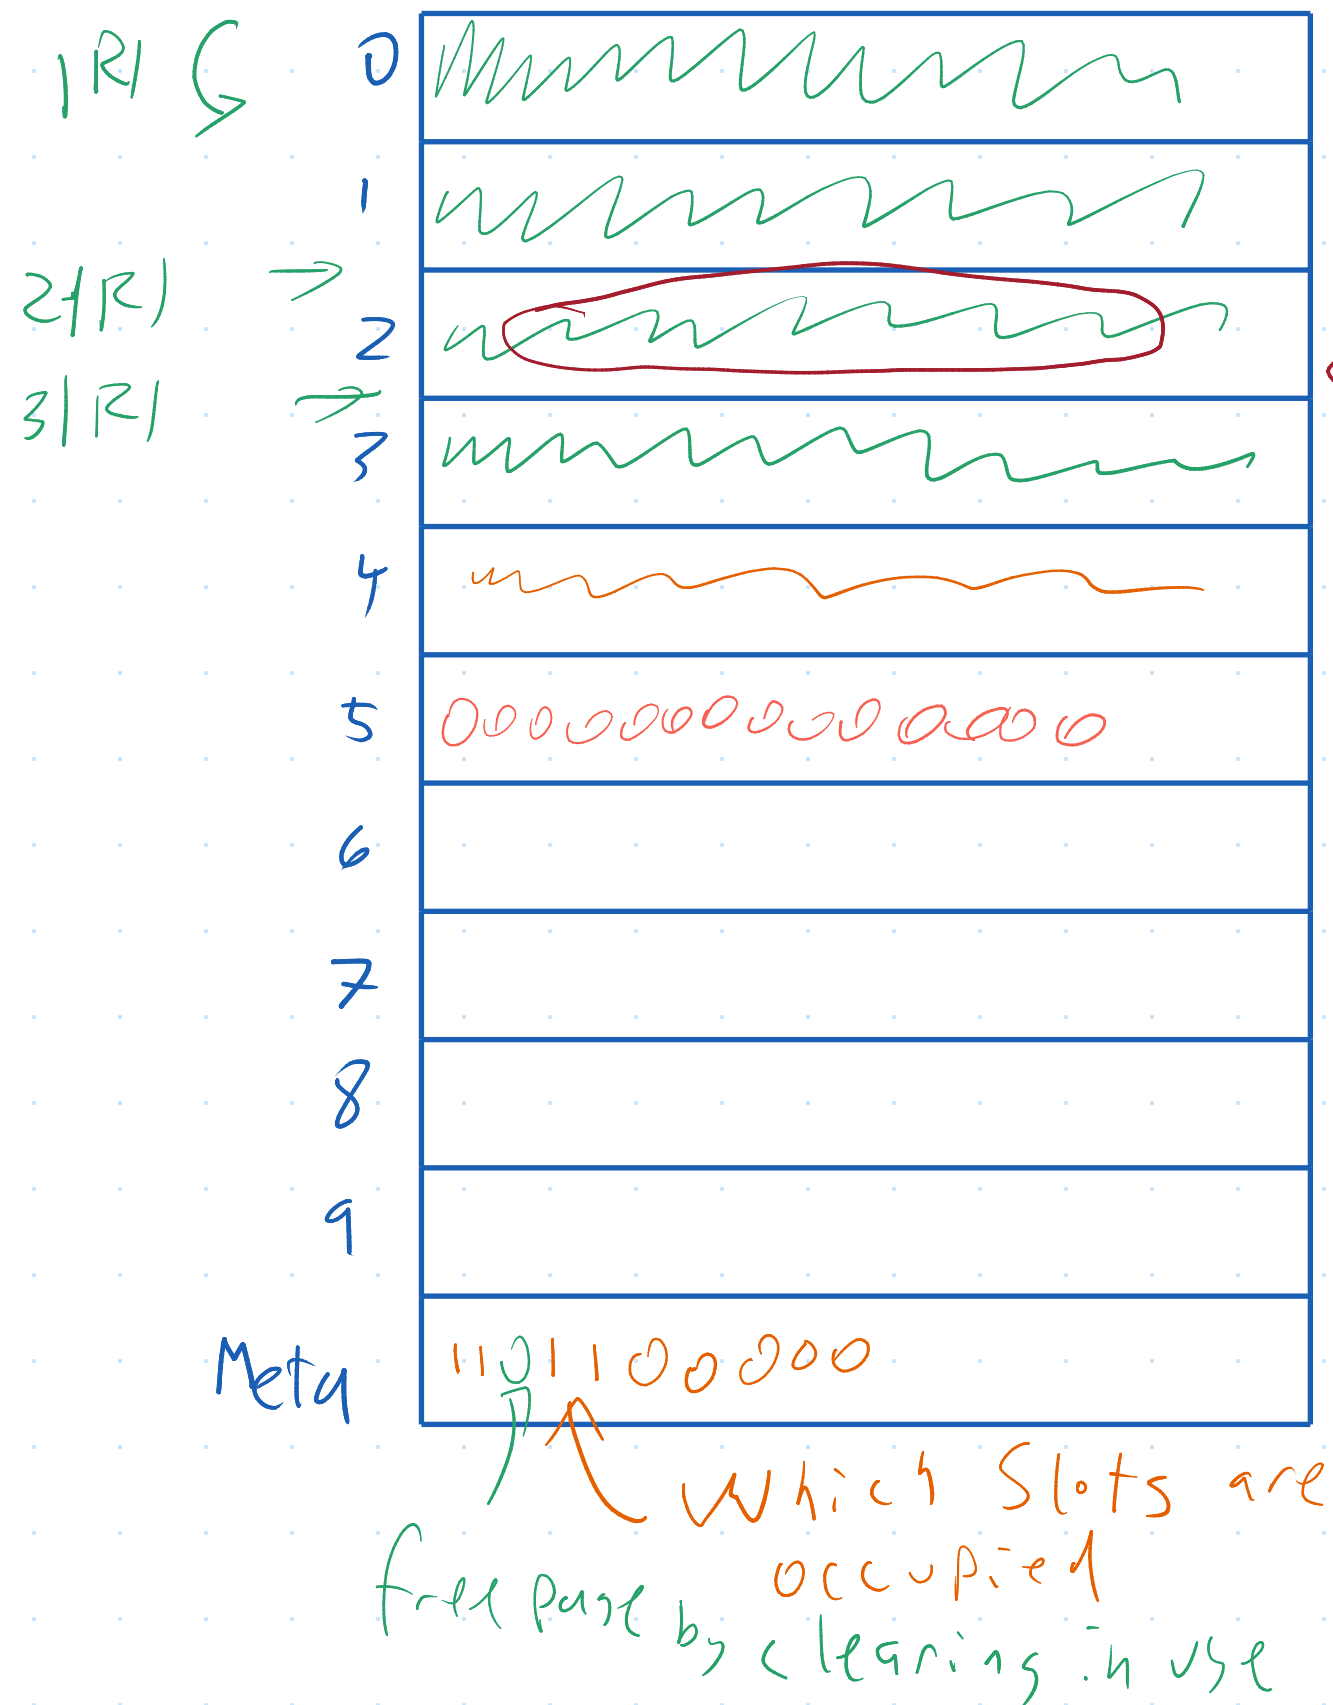

Tricks: Same

Identity: RID instead of field  
↳ Array, not struct

↓  
variable length  
fixed type

↓  
fixed length  
variable types

## Variation 1: Fixed

What is a RID  
Index of Slot

Where can I add  
the next record  
store in-use bits

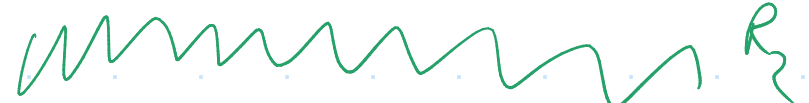

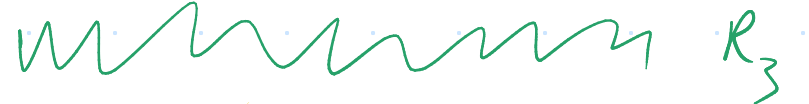

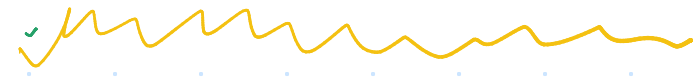

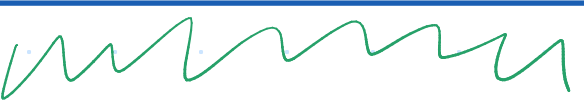

← RID = 2

Pros/ - somewhat fast  
allocation  
- fast retrieve (1)

Cons/ - stuck w/ fixed  
size records

## Variation 1b: Fixed (Packed)

Same basic idea

0	 $R_1$
1	 $R_2$
2	 $R_3$
3	
4	 $R_5$
5	
6	
7	
8	
9	
Meta	4

Delete  $R_4$

Move last  
record into its spot

Pros/ - Records together  
- Faster allocation

Cons/ - Array index no longer  
stable

## Variation 2: Delimited

Don't

## Variation 3: Footers

Pros/

- Variable size records
- $O(1)$  record access

Cons/

- Needs periodic compaction

			-	9	9	9	9	\$	'	0	
--	--	--	---	---	---	---	---	----	---	---	--

predictable location      Free Space

# Challenge 3: Page Assignment

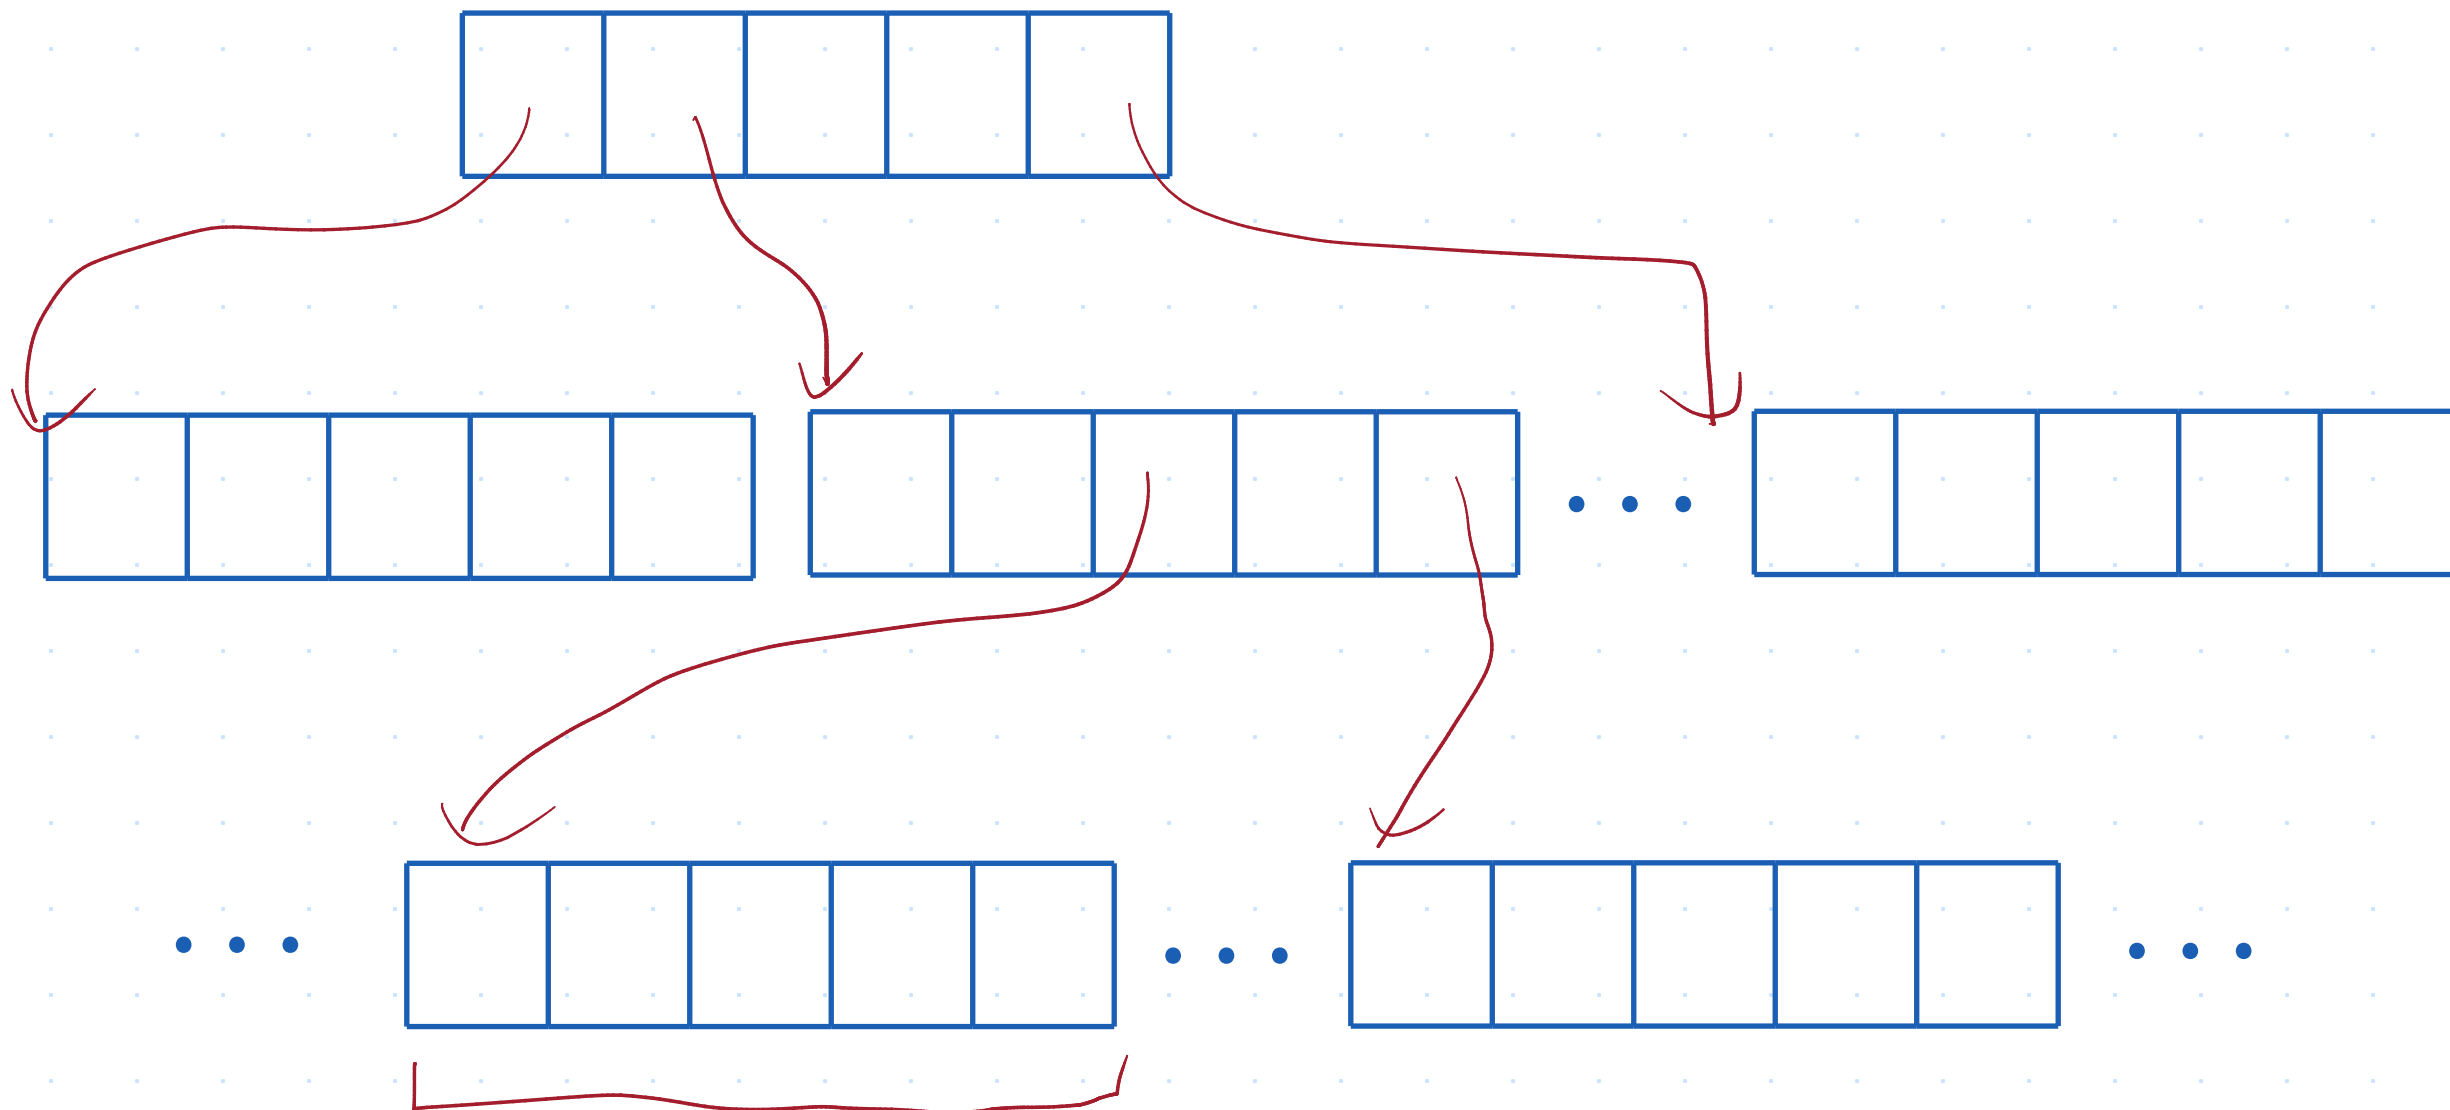

## Variation 1: Linked List

## Variation 2: Inode

# Columnar Data

A1	B1	C1	D1
A2	B2	C2	D2
A3	B3	C3	D3
A4	B4	C4	D4

A1	B1	C1	D1
A2	B2	C2	D2
A3	B3	C3	D3
A4	B4	C4	D4
File 1	File 2	File 3	File 4
